

Rejserapport for Teknik- og Miljøudvalgets studietur om mobilitet og cirkulær økonomi til Amsterdam den 7.-10. juni 2022

Teknik- og Miljøudvalget vedtog den 9. maj 2022 program for Teknik- og Miljøforvaltningens studietur om mobilitet og cirkulær økonomi til Amsterdam i 2022. Studieturen blev foretaget den 7.-10. juni 2022.

Teknik- og Miljøforvaltningen forelægger rejseregnskab for udvalget som sag til orientering, når alle regninger er modtaget til det endelige regnskab.

Tirsdag den 7. juni

Udvalget rejste med tog fra København til Amsterdam. Under togturen fik udvalget præsentationer om mobilitet og grøn klimatilpasning af vicedirektør Peter Højer (Mobilitet, Klimatilpasning og Byvedligehold), samt om cirkulært byggeri og stormflodssikring af vicedirektør Karsten Biering Nielsen (Plan, Analyse, Ressourcer og CO2-reduktion).

Oplæg supplerede udvalgets endags cykeltur i København den 2. maj 2022 med viden om studieturens emner.

Onsdag den 8. juni

Udvalget cyklede i Amsterdam og fik oplæg af byudviklingsguiderne *Anneke Boeken* og *Paul Vlok* fra ArchiTours.

Cykling langs De Rode Loper

Mobilitet: Cykelkultur, cykelparkering og konvertering af p-pladser til rekreative funktioner

Udvalget blev i løbet af dagen introduceret til den hollandske cykelstrategi med eksempler på cykelparkering og skiltning til cykelparkering, herunder helhedsorienterede byrumsløsninger, udvidelsen af cykelstier til design af cykelstier, rundkørsler og kryds, beskyttede cykelsvingbaner i kryds, cykeltgader, trafikdæmpning i gader og adgang for cykler, separation af cykel og biltrafik med begrønning – samt område med cykelparkeringsforbud *De Rode Loper*, herunder *Ferdinand Bolstraat* (som er en del af *De Rode Loper*).

Udvalget startede ved **Amsterdam Centraal**, IJpleinveer De Ruijterkade. Her blev **Car Low-programmet** introduceret af Wiard Kuné, strategisk rådgiver indenfor trafik og offentligt rum, Amsterdam Kommune (bilag 1 og 2).

Stationsområdet er Amsterdams knudepunkt for offentlig transport med 250.000 mennesker hver dag (både indbyggere og besøgende). Udvalget så infrastrukturen omkring stationen, hvor de forskellige transportformer var adskilt i etager. Fodgængere og cyklister færdedes på 'grundplan', mens busser og biler blev ledet af en bro til stationen. Gaden IJpleinveer De Ruijterkade var desuden anlagt med begrønning for at adskille cykel- og biltrafik.

Ved stationen oplevede udvalget desuden funktionen '**shared space**' ifm. færgers pendulfart, der forbinder Amsterdam station og centrum med bydelen på den anden side af floden, idet der endnu ikke er bygget broer og heller ikke bliver det på den centrale strækning. Der er på sigt planer om broer i østlig og vestlig ende af Amsterdam som supplerende forbindelsesled. På et 'shared space' færdes fodgængere primært på et område markeret med grøn belægning, cykler på et område med rød belægning og alle mødes på et område med grå belægning, hvor

fodgængere og cyklister færdes med gensidig øjenkontakt. Efterfølgende fletter fodgængere og cyklister ind på hhv. fortov og cykelsti.

'Shared place' for cyklister og fodgængere ved Amsterdam Centraal Station mod færger, der forbinder Amsterdam med pendulfart (rød belægning for cyklister, grøn for fodgængere, grå for både cyklister og fodgængere)

Amsterdam Centraal var første **parkeringsområde**, udvalget blev introduceret til. Der var bl.a. bygget et cykelparkeringsanlæg i etager udenfor stationsbygningen, der var ansat personale til at guide til parkeringsmuligheden sammen med tydelig og konsekvent markering med pile og små plakater på bl.a. affaldsspande af, hvor cykelparkering var mulig. Denne måde at kommunikere steder for cykelparkering fandtes i hele byen. Ved stationen blev cykler fjernet og som et af de eneste steder blev der udstedt bøder, hvis cyklerne ikke stod i de markerede cykelparkeringspladser. I resten af Amsterdam blev cykler fjernet og placeret på lager i udkanten af byen, hvor cykelejer kunne afhente cykel gratis. Hvis cyklen ikke blev afhentet efter seks uger, blev den fjernet og betragtet som mistet for ejeren.

Udvalget cyklede langs **De Rode Loper**. De Rode Loper er et projekt, der skal give gaderne et løft efter metrobyggeri. Strækningen har den samme røde farve for at markere sammenhængen på tværs af de områder, den går igennem.

Derefter var der fokus på cykelinfrastruktur, planlægning, finansiering og drift af cykelparkeringsanlæg med **Leidseplein** cykelparkeringsanlæg under jorden som eksempel. Anlægget blev præsenteret af *René Dronkers*, Amsterdam Kommune. Af præsentationen fremgik en alternativ adgangskonstruktion til cykelanlæg generelt (bilag 3).

Cykelparkering under jorden, Leidseplein, Amsterdam, ZJA Architects, m.fl.

På pladsen Leidseplein besøgte udvalget et underjordisk cykelparke-
ringsanlæg, der er anlagt for at etablere én mere attraktiv plads til op-
hold. Cykelanlægget var tilgængeligt døgnet rundt og gratis de første 24
timer, hvorefter der blev betalt knap 2 euro pr. time. Anlægget var des-
uden med personale. En mangel ved anlægget var, at der ikke var handi-
captilgængelighed. Rampen til anlægget blev drøftet ift. andre løsninger
som eksempelvis sliker, der kunne være mere tilgængelige også ved
brug af ladcykel. I anlægget var der mulighed for opladning af elcykler.

*Trappenedgang med sliker og betalingsautomater til cykelparkering under jorden,
Leidseplein*

Arkitektonisk afspejlede cykelanlæggets væg en karakteristisk arkitektur
med røde mursten i forskudte lag fra eksisterende bro ved pladsen.

Byrum over cykelparkeringskælder, Leidseplein

Markeringen af cykelanlægget var med en grøn stander, hvor den grønne farve bl.a. gik igen i kommunikationen andre steder på fx mærkater på affaldsspande.

Selve byrummet, der var skabt efter, at cyklerne parkeres under jorden, blev umiddelbart oplevet som et bart rum uden indbydelse til ophold. Der var et område med græs, afgrænset af en stenkant man kunne sidde på, men på pladsen var ingen bænke, legeplads el.lign.

Efterfølgende cyklede udvalget videre og så områder af Amsterdam, hvor man ved at nedlægge **bilparkeringspladser** skaber sikrere trafik og mere plads ved at redesigne fortov, vej og sporvognsskinner, så der skabes plads til grønt, opholdsarealer, cyklister og fodgængere.

Gade med forbud mod parkering, med begrønning, cykelparkering og afsætningspladser

I forbindelse med nedlæggelse af bilparkeringspladser var parkeringskælderen 'Albert Cuyp Garage' anlagt under en af kanalerne. Der var plads til 600 biler, 77 elladestandere og 60 cykler.

Albert Cuyp Garage, projekt og set fra gadeplan med nedgang til parkeringskælder

Silodam, boligkompleks ved havnefronten

Udvalget blev vist rundt i den vestlige del af Amsterdam havn, Silodam (bilag 4). Dette havneområde blev udviklet omkring 2003, dels for at skabe fortætning ind mod centrum, dels for at imødekomme behovet for flere boliger. En tidligere dæmning med en silobygning er blevet transformeret til et boligområde. I tillæg har man foretaget store investeringer, bl.a. i en dæmning med en nedgravet p-plads, renovering af de gamle siloer og udvikling af også billigere almene boliger i forskellige boligtypologier.

Udvalget besøgte et mixed-use boligblok, opført af skibscontainere, placeret for enden af dæmningen. Projektet er udviklet af den anerkendte og eksperimenterende hollandske tegnestue MVRDV i 2003: 157 lejligheder (15 leje og resten ejer), erhvervslokaler, retail og fællesrum (bibliotek, fitness, grill-område mv.) er indeholdt i den 20 meter dybe og 10 meter høje bygning.

Silodam, mixed-use projekt, dvs. med boliger, erhverv, retail og fælleslokaler

Grøn klimatilpasning i Bellamybuurt-kvarteret (Amsterdam Rainproof)

Udvalget besøgte det lavtliggende boligområde Bellamybuurt med grønne klimatilpasningsløsninger. Klimatilpasning knyttes sammen med biodiversitet i forbindelse med Amsterdams regnvandshåndtering, der er inspireret af Københavns skybrudssikringsplan. Amsterdams skybrudssikring 'Amsterdam Rainproof - every drop counts' er primært baseret på overfladeløsninger. Det munder ud i tiltag for at gøre byen mere grøn, fra grønne anlæg, legepladser og fjerne fliser på fortove til fordel for grøn beplantning, som borgere kan udføre, til mere omfattende grønne infrastrukturprojekter. I Holland har man i den forbindelse udviklet et særligt grønt tag - poldertag - der imiterer de polder, der dræner inddæmmede arealer.

Udvalget hørte i den forbindelse om en netværksorienteret tilgang af Daniel Goedbloed, Amsterdam Kommune, med input fra arkitekt og beboer Minke Wagenaar (bilag 5). Målet er at tænke i helt nye løsninger/anlæg, samtidig med at klimatilpasningsløsningerne driftes ude i lokalmiljøerne. Netværket består derved af nøgleparter fra byen, vandselskaber m.v.

Gade i Bellamybuurt-kvarteret med vandafledning, begrønning og cykelparkering,

Torsdag den 9. juni

Den hollandske model for stormflodssikring

Udvalget fik præsenteret hovedtrækkene ved den hollandske finansieringsmodel, der er mere kollektivt funderet, ved *Quiijin Lodder*, Principal Advisor Coastal Flood Risk Management Rijkswaterstaat (bilag 6). Finansiering foregår via en fond på nationalt plan (Deltafonden) og vandbestyrelser, der opkræver skatter, på regionalt plan. Fællestræk mellem Amsterdam og Danmark er, at en oversvømmelse kan ramme mange mennesker, boliger, erhverv og vital infrastruktur med store tab til følge.

I Holland var der siden 1950'erne erfaring med at bygge større dæmninger/porte til at håndtere store mængder vand og beskytte de ca. 2/3 af Holland, der ellers ville blive oversvømmet. Deres erfaring var, at det er vigtigt, at det ikke bliver for teknisk kompliceret, da der derved er større risiko for, at dæmning/porte ikke virker.

Generel introduktion til Amsterdam Smart City

Udvalget fik rundvisning og indblik i organisationens arbejde af *Leonie van den Beuken*, Program Director, og *Cornelia Dinca*. Amsterdam Smart City arbejder med nye løsninger inden for byudvikling og klimatilpasning på tværs af faggrupper og institutioner – og i samråd med borgerne. Organisationen har en vidensplatform, der består af virksomheder, kommuner, regioner og beboere. Målet er at skabe forbindelser og nye kreative løsninger via de forbindelser mellem faggrupper og folk.

Elbil fra 1970'erne

Amsterdam Smart City, udstilling 'Energy Junkies'

Oplæg om Amsterdam Net Zero 2050

Udvalget fik indblik i, hvordan Amsterdam har benyttet et borgerråd med udvalgte borgeres forslag til den fremtidige klimaplan (forelagt bystyret i februar 2022). Borgerne blev bedt om at hjælpe med at udvikle initiativer og indsatser for at bidrage til byens reduktion af CO₂ udledning. På møder har borgerne drøftet og fået oplæg til inspiration. 10 ud af 26 forslag vurderer Amsterdam pt. bidrager til CO₂ reduktion, mens de resterende var for omfangsrige ift. finansiering og lovgivning. Oplæg ved *Kim de Jong*, strategisk rådgiver inden for bæredygtighed i Amsterdam Kommune. (Der indgår ikke bilag til dette punkt, da der ikke er modtaget oplæg).

Cirkulær økonomi i byggeriet: Buiksloterham og genanvendelse af byggematerialer

Udvalget så det tidligere havne- og industriområde på 100 hektar, hvor der planlægges ca. 6.500 boliger. Byudviklingsguide Gebhard Fried, Architours, præsenterede området og Amsterdam Kommunes planer for at omdanne området til byens første cirkulære bolig- og erhvervskvarter, bl.a. med egne energi- og affaldssystemer.

I området sås forskellige typer projekter, herunder også boliger opført af genbrugsmaterialer, byplan/fortætning samt rekreative arealer.

De Ceuvel i kvarteret Buiksloterham – kreativ hub med arbejdspladser for iværksættere, kunstnere m.fl.

Buiksloterham fungerer som et levende laboratorium for cirkulær, smart og biobaseret by. Der er udarbejdet handlingsplan for at sikre, at mål for bydelen om bl.a. selvforsynende med energi, affaldsfrit kvarter, bygninger er cirkulære.

Flydende boliger som byggefællesskab i kvarteret Buiksloterham

De fleste boliger er opført af private byggefællesskaber, fra det højeste træbyggeri i Amsterdam til en flydende bydel bestående af 30 huse. Man samarbejder også med boligselskaber.

Byggefællesskab med trækonstruktion

Byggefællesskab 'Stories' med trækonstruktion

Udvalget besøgte en lejlighed i et boligbyggeri af træ under konstruktion 'Stories'. Projektleder fortalte om projektet med byggefællesskabet. Der er i byggeriet taget højde for, at byggeriet kan benyttes til forskellige funktioner. På nuværende tidspunkt forventes det benyttet som boliger, men det er bygget med en loftshøjde, der tillader, at det også kan benyttes til erhverv. Desuden er vægge mobile både i lejligheden, men også på tværs af lejlighederne, så størrelserne let kan tilpasses en ny funktion.

Noorderlicht Café - bygget og indrettet med cirkulære materialer

Udvalget afsluttede dagens program på et rekreativt areal omkring Noorderlicht Café.

Oplæg om, hvordan Amsterdam Kommune og interessenter har arbejdet med at skabe grundlæggende forandringer i forhold til cirkulært byggeri

Udvalget mødtes med Imme Groet og Kees Stants, Sustainability team and leader of EU Affairs, Amsterdam Kommune. Udvalget blev præsenteret for det cirkulære program, som Amsterdam har sat i gang, samt 'The Green Deal' med brug af træ i byggerier (bilag 7).

Programpunkt om arbejdet med at skabe grundlæggende forandringer i forhold til cirkulært byggeri blev aflyst, da oplægsholder blev forhindret i at deltage.

Fredag den 10. juni

Hjemrejse med hhv. tog og fly.

Deltagere på studietur

Der deltog otte medlemmer af Teknik- og Miljøudvalget og seks embedsmænd fra Teknik- og Miljøforvaltningen.

Creating space in Amsterdam

Agenda for a liveable & accessible city

Creating space in Amsterdam: Agenda for a liveable & accessible city

The key aim of this agenda is creating space. Space to walk, to cycle, to play and to enjoy our green spaces. So that Amsterdam can continue to be an accessible and liveable city for the next 20 years - a place where people want to live, work and relax. To achieve this, we're reducing the amount of space given to cars in our city. The Agenda for a liveable and accesible city includes targeted, practical measures for our streets and for innovative experimentation, and it identifies the main points that we still need to work on. It shows what we're doing NOW (period until 2022), SOON (period until 2025) and LATER (period until 2040), to build on what has already been achieved.

Goals of the agenda

Page 4

Trends and developments

Page 11

On the road to a liveable and accessible city

Page - 18

Implementing The agenda

Page 27

I. Goals

5 goals for a liveable and accessible city and region

1. More space for functions associated with passing the time

2. More space for amenities

3. More space for alternatives to the car

4. Cleaner air, less noise nuisance and greater road safety

5. Inclusive city

Goal 1: More space to enjoy spending time in the city
Spatial reallocation benefits the quality of public space by adding more green space or play facilities.

BEFORE

AFTER

Goal 2: More space for facilities

The space that has been created can then be used for facilities such as waste containers, bicycle stands or loading and unloading areas.

Foto: Thomas Schlijper

BEFORE

AFTER

Goal 3: More space for clean and active forms of transport

We're creating more space for cyclists, pedestrians and public transport.

BEFORE

AFTER

Goal 4: Cleaner air, less noise pollution, better traffic safety

The measures in this Agenda are helping to reduce car traffic, making our air cleaner and our roads more efficient.

BEFORE

AFTER

Foto's: Thomas Schlijper

Goal 5: An inclusive city for young and old, high income and low income

Everyone can travel from A to B comfortably and affordably.

II. Trends and developments

The region is facing a major growth challenge: >290,000 extra homes by 2040

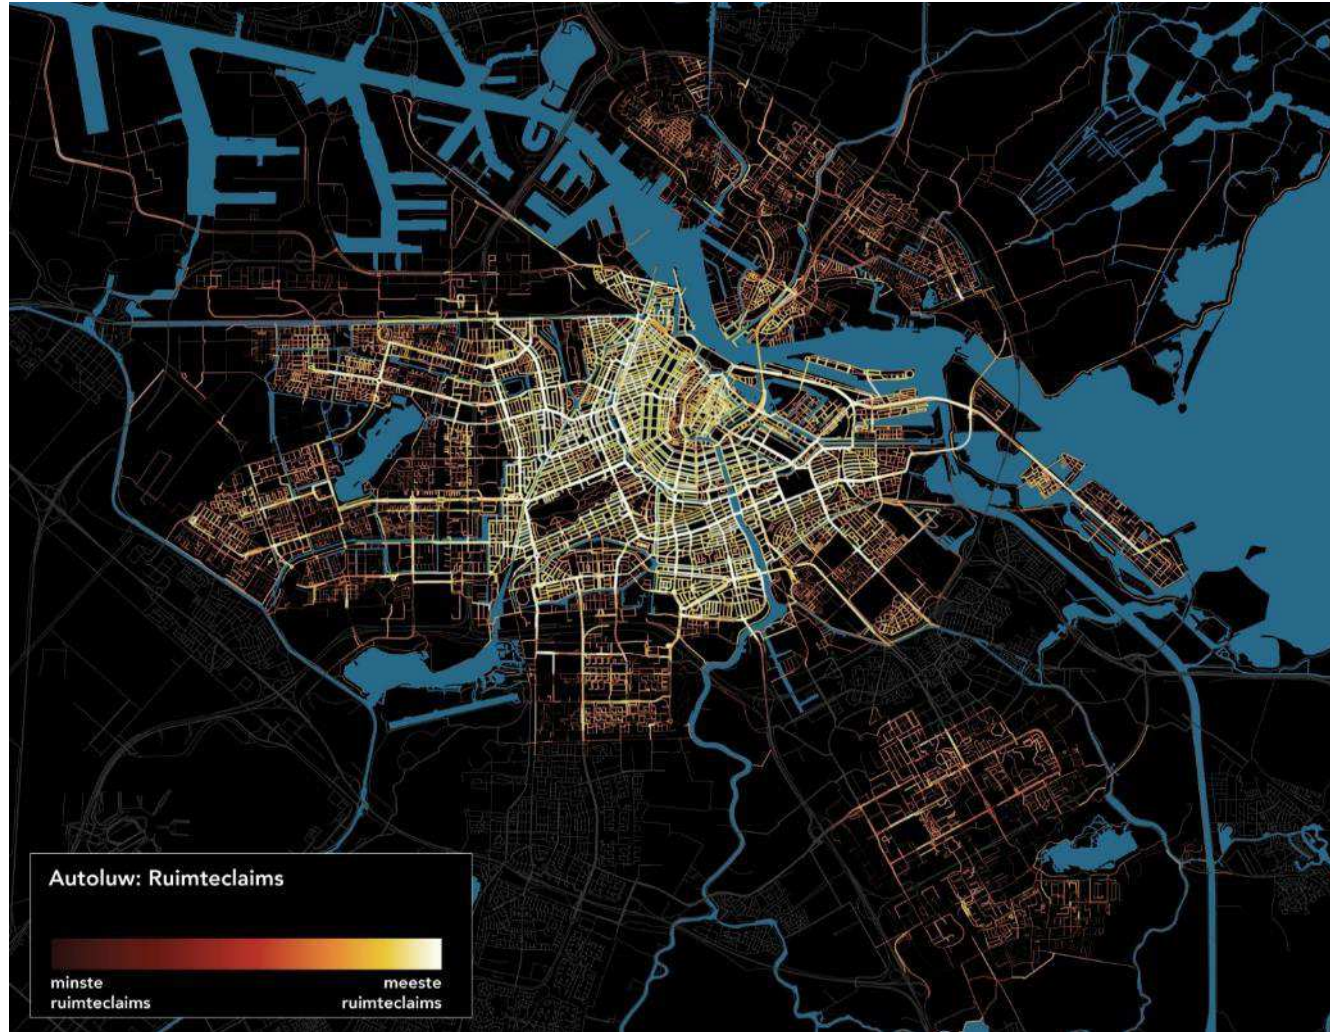

If no action is taken, the number of car journeys will also grow, reducing quality of life and accessibility

The demand for space is enormous

It is highest inside the A10 ring road, to the south of the river, the IJ

The map shows the pressure on our public space and the urgent need to minimize car usage. We looked at the demand for space from: pedestrians, cyclists, parked bicycles, traffic flow for public transport, accessible bus/tram stops, traffic flow for cars, facilities (such as waste containers), play areas, narrow canals, spatial quality, trees and rain-proofing measures.

Cars require the largest amount of space per user

That is why we want to reduce the footprint of cars in our city (in terms of space, emissions and noise)

Amsterdam is a cycling city, and car use has been declining since 1986

Residents mainly use their bikes to get around the city

Trips made by residents of Amsterdam from, to and within the city

Trips made to and from Amsterdam are often made by car

That is why a regional approach is important

Trips to and from
outside Amsterdam
(2017)

Residents(%)

 Walking
 Other

Logistics networks ensure that our city continues to function

Every day, 25,000 delivery vehicles and 6,000 trucks inside the A10 ring road. Of all road traffic, 15% is logistics

III. On the road to a liveable and accessible city

Step by step, we're creating more space

We are doing what is possible *today*, beginning work on what we will be doing *soon*, and preparing for what we want *later*

We're introducing slower traffic in various streets NOW, to make space for recreation (such as along the Amstel and Weteringcircuit). Some changes will take more time, because we first need to take measures to reduce car ownership and usage. With the free space that is created, ever more locations around the city will SOON become pleasant residential areas (such as Van Woustraat and Nieuwezijds Voorburgwal). The ambition is that LATER, clean and active modes of transport will dominate mobility in the region. Then we will have the space to redesign our main roads (such as part of Stadhouderskade, in this example).

NOW (period until 2022)

SOON (period until 2025)

LATER (period until 2040)

Step by step to a liveable and accessible city

MORE CLEAN AND ACTIVE MODES

MAKING SPACE BY REDUCING CAR TRIPS

MORE SPACE DUE TO FEWER PARKED CARS

PLEASANT PUBLIC SPACES

Step by step to a liveable and accessible city

MORE CLEAN AND ACTIVE FORMS OF TRANSPORT

1

There are more and more neighbourhood initiatives to improve the living environment. Employers are also offering alternatives to car use more often. We will support these types of developments throughout the city. We are making the transition to different modes of transport easier by investing in wider pavements and cycle lanes, and good and affordable public transport across the city and region

CREATING SPACE BY REDUCING CAR TRIPS

2

We are working towards a city where large, contiguous areas are given over to pedestrians, cyclists and public transport, where traffic is better distributed throughout the day, and where urban logistics are cleaner, lighter and more efficient.

CREATING SPACE BY REDUCING PARKING

3

We are taking measures to reduce the demand for parking space. This will enable us to remove parking spaces and create more room. We are avoiding any major parking issues by providing alternative parking locations for car owners.

PLEASANT PUBLIC SPACES

4

We are applying different design principles to different areas of Amsterdam. Each area has its own distinctive character, and therefore merits its own approach.

1. More clean and active forms of transport (1/2)

investing in more public transport, space for pedestrians and bicycles and shared mobility

NOW (period until 2022)

SOON (period until 2025)

LATER (period until 2040)

- Increased frequencies
- Accessible bus/tram stops
- Night metro pilot
- Encouraging small local public transport initiatives

- Improved traffic flow for trams and buses
- Adding new public transport lines
- More and more timetable-free services
- Improved regional (bus) connections

- New metro connections
- Scaling up: public transport across the city and regions

1. More clean and active forms of transport (2/2)

Investing in more public transport, space for pedestrians and bicycles and shared mobility

NOW (period until 2022)

SOON (period until 2025)

LATER (period until 2040)

- › Shared bicycles at metro stations
- › Expand comfortable bicycle infrastructure
- › Tackle top 15 pedestrian bottlenecks

- › Expand regional bicycle network
- › Start of construction of second cycle path ring along Frederik Hendrikstraat - Ceintuurbaan

- › High-quality bicycle infrastructure network
- › Large, contiguous residential areas

2. Creating space by reducing car trips

We are working on the streets where this is already possible. In other streets, we are implementing circulation measures.

NOW (period until 2022)

- › 30 km/h limit in residential streets, more bicycle and public transport in quieter city streets
- › Research limited access zones for traffic
- › Behavioural measures, including the approach of employers

SOON (period until 2025)

- › Circulation measures in more city streets to reduce car traffic
- › Expand intelligent access to keep traffic out of residential areas

LATER (period until 2040)

- › Interventions to reduce car traffic on main routes
- › Large, contiguous residential areas

3. Fewer stationary cars in the city, step by step

NOW (period until 2022)

- › Expand and increase usage of P+R
- › More shared mobility
- › Neighbourhood budgets for green measures
- › Reduce number of parking permits

SOON (period until 2025)

- › Up to 10,000 fewer parking spaces
- › Expansion of P+R Noord and addition of new locations
- › Clear and extensive regional P+R facilities

LATER (period until 2040)

- › City streets without parked cars
- › Residential areas without parked cars
- › Canals without parked cars
- › City centre without parked cars

4. Pleasant public spaces
Locally oriented design principles

City centre
Creating space for cyclists and pedestrians, places to live and meet

City streets
Create space for the dynamics of urban life

Canal District
More space to appreciate the beauty of the canals

Mixed residential areas
Free up space to guarantee the quality of life

Working areas
Space for cars, opportunities for bicycles and public transport.

Main routes
Providing space for traffic flow

**Local regeneration area
The New City**
Space for urban living

IV. Transition already In progress

Implementing the Agenda

We are carrying out pilots, projects and research as part of the programme
Programmatic Implementation of Car-Free Measures (PUMA)

The Agenda marks the start of an ambitious programme. We are setting up pilots, projects and research as part of the current Programmatic Implementation of Car-Free Measures (PUMA), or we are integrating them into the line organization or other ongoing thematic programmes, such as the Long-Term Bicycle Plan and the Taxi Programme.

In parallel to our preparations for the agenda, we have begun to introduce a number of measures announced in the coalition agreement. For example, parking fees for visitors have been increased and we have begun to remove street parking spaces.

Supplement

✘✘✘ Different design principles for different areas

Each area of the city has its own distinctive character, and therefore merits its own approach.

Every area in our city is unique. Whether it is the city centre or the main routes, city streets or residential areas, or the new city or our centuries-old canal district.

The Agenda is creating more space for a liveable and accessible city. We are implementing this differently in different areas across the city.

City centre

Creating space for cyclists and pedestrians, space to live and meet

City centre

We want to guarantee quality of life in the city centre, increase the amount of space for pedestrians and improve its attractiveness for residents.

DESIGN PRINCIPLES

We will phase out ground-level parking. The ambition is to make the streets free of parking wherever possible.

We are creating more space for loading/unloading and bicycle parking facilities, small electric vehicles and shared mobility.

Streets and squares are being improved and rejuvenated with climate-proof solutions, high-quality materials and more greenery.

City streets

Creating space for the dynamics of urban life

The city streets are where all the dynamic energy of urban life comes together. Because of their robust traffic function(s), they are important links in the network.

— city street - - - Potential city street

Before: a city street (50 km/h) with parallel parking and separated cycle paths

DESIGN PRINCIPLES

We are making our urban streets free of parking whenever we renovate them, if that space is needed for other functions (bicycles, pedestrians, residential, etc.). We are designing that space as flexibly as possible. For example, by combining bicycle parking facilities with loading and unloading areas. Wherever possible, we are mixing traffic modalities (bicycle/car or car/tram) and reducing the maximum speed (30 km/hour).

After: a parking-free city street (30 km/h) that includes space for greenery and accommodation

✘ Canal district

✘ More space for the beauty of the canals

Amsterdam's Canal District is a UNESCO world heritage site. So we need to take great care of it. By limiting the footprint of cars, we are improving accessibility and quality of life in this area of the city: more space for bicycle parking and wider pavements.

Canal district

Before: a canal with angled parking spaces and narrow pavements

DESIGN PRINCIPLES

We are converting angled parking spaces into parallel parking spaces.

We are making the narrower canal sides (<7m) parking-free wherever possible during renovation work.

Through traffic no longer possible due to circulation interventions or intelligent access.

In the medium term, we will make a number of stretches along the main canals completely free of parking.

After: parallel parking spaces and wider pavements.
Along the water, parking spaces can also make way for bicycle parking stands or trees.

✘✘✘ (Mixed) residential areas

Freeing up space to guarantee quality of life

The mixed residential areas are the neighbourhoods that surround the city centre, with a lot of retail and catering facilities along the existing city streets, but also increasingly in residential areas such as the Pijp, the Jordaan, the Indische Buurt and Oud-West. The interspersing of quiet and busy areas is sometimes under pressure due to the location of public functions in residential streets. .

— (mixed) residential areas

Before: a narrow street with parallel parking along both sides

DESIGN PRINCIPLES

In the short term, we will eliminate parking spaces through temporary measures, such as adding planters or bicycle racks.

During renovation projects, we will convert some of the parking spaces into bicycle parking, green space or play areas.

The speed limit for (car) traffic in residential areas will be limited to 30 km/h.

We will create hubs for shared mobility, so that residents can switch from ownership to shared usage.

After: by removing parking along one side, there is space for green, play areas, trees, bicycle parking, etc

××× Working areas

××× Space for cars, opportunities for bicycles and public transport

■ Working areas

Amsterdam has a number of business and office areas, both inside and outside the A10 ring road. Here, it is not only the business/logistics function that is important, but also how people travel to and from work. We are building a new, car-free city, but the existing city must also continue to function.

DESIGN PRINCIPLES

Guaranteeing the accessibility of business areas so that companies can continue to function properly.

We are investing in the quality of continuous bicycle connections, so that visitors and employees can cycle more easily and conveniently. During renovation projects, we are focusing on adding green spaces to improve the quality, biodiversity and climate-resilience of working areas

✘✘✘ Main routes for road traffic

Providing space for traffic flow

— Main routes for road traffic

Car-free' means more than simply keeping cars out of the city. In the first instance, we will limit through traffic from smaller roads wherever possible. This means that we will funnel the traffic more towards the city's main routes (as well as the motorways and larger roads). Here we want to ensure that traffic can flow as freely as possible. At a later stage, we will look at whether we can reduce car traffic through targeted measures or even redirecting it entirely.

DESIGN PRINCIPLES

In the short term, we will guarantee the capacity and flow of local vehicle traffic along these main routes.

Wherever possible and where necessary, we will remove parking spaces to improve traffic flow or to make space for facilities (fast charging points, coach stops, etc.).

We are investigating whether the A10 could assume (some of) the functions of the main urban routes.

Development areas

New city

■ New city

With urban development areas such as Havenstad and IJburg-2, new types of areas are being added to the city, focused on active travel. Public space offers plenty of space for walking and cycling, and there is a lot of green space and spaces for meeting, playing and recreation.

DESIGN PRINCIPLES

We are creating public space that is green and climate-proof, focused on movement, residential and meeting places.

Parking will no longer be at ground level, but indoors or remote, so that our streets will be free of parking.

Alternatives to car ownership and car use are shared mobility, high-quality public transport, attractive bicycle routes and space for pedestrians

Forslag adgang til nyt cykelskur

Prins Hendrikkade Centraal Station 'Entree'.

8-4-2020

(Denne tekst er oversat fra hollandsk til dansk via google translate, der kan derfor forekomme enkelte sproglige fejl)

Det nye parkeringsanlæg ved Hovedbanegården åbnes i slutningen af 2021 og vil give plads til cirka 7.000 cykler. Den nye parkeringsplads er tilgængelig på cykel fra Piet Heinkade. Stalden er tilgængelig ved at gå ind i et "Tapis-Roulant" (rullende tæppe). I alt vil der være tre tapis-roulanter ved siden af hinanden for tilstrækkelig flow af antallet af cyklister.

En tapis roulant har et smart og brugervenligt udseende, men har også en vigtig ulempe.

Når det regner, er tapis-roulanterne glatte og uden tag kan de ikke fungere i tilfælde af regn. Eller kun opad. Af årsager hos Welstand er det nødvendige tag endnu ikke realiseret. Det har store konsekvenser for parkeringsanlæggets tilgængelighed og sikkerhed. At gå en tapis roulant med en cykel i hånden øger risikoen for fald. Det er næsten umuligt at bruge en stationær tapis roulant til handicappede.

Løsning med delvist tapis-roulant system

Med den begrænsede offentlige plads i Amsterdam er korrekt cykelparkering af stor betydning for en attraktiv og tilgængelig by. Inden for cykelparkeringsteamets flaskehalstilgang arbejdes der med nye succesfulde løsninger til cykelparkering ud fra et brugerperspektiv (her cyklister). Udover Amsterdam-oplevelsen holder cykelparkeringsteamet også øje med cykelparkeringsoplevelsen udefra.

Vi ser, at der er blevet realiseret en række mere brugervenlige underjordiske parkeringsfaciliteter i byerne Groningen, Nijmegen og Utrecht. Disse byer har et underjordisk parkeringsanlæg, der kan cykles ind. Det er nemt at forklare, hvorfor dette opleves som meget cykelvenligt.

Det er kendt fra adfærdsvidenskaben, at en adfærdsændring (i dette tilfælde indendørs parkering) er lettest at opnå, når den nye, ønskede adfærd er tæt på den intuitive adfærd. Vi ser, at cyklister godt kan lide at cykle til deres endelige destination og så gerne vil parkere. Stå af så lidt som muligt og gå så lidt som muligt. Ved parkering i den underjordiske parkeringsplads 'de Entree' bedes du i god tid stå af og tage ruten ned med din cykel og parkere. Ved de nye parkeringsanlæg i førnævnte kommuner kan cyklister komme ind i skuret, af og parkere med det samme. Uden trængsel i toppen af indgangen.

Dels på grund af problemer forårsaget af en udækket tapis roulant (glatte forhold, risikofyldt gang med cykel i hånden, teknisk jævnligt ude af brug og negativ indberetning på grund af funktionsfejl og fald), er der foretaget en hurtig scanning af mulighederne for kan cykles ind.

Eksisterende

Ny

Sammen med en arkitekt er muligheden overvejet, beregnet og tegnet for at skabe en indgang indenfor det allerede færdige byggeri mål, der gør, at cyklisterne kan trille ned på cyklen.

Nedstigningen på cykel til

Indgangen via tapis roulant for den udgående strøm af besøgende. Til højre er den (eksisterende) trappe, hvor publikum kan hente cyklen.

Nedstigning og kurver:

Den tre meter brede nedkørsel giver plads og overblik til at klare nedkørslen og bremse før svinget.

Nedstigningen og svinget kan i nogen grad sammenlignes med situationer i byen, såsom broen ved siden af cykellejligheden. Også her ender skråningen i et sving. Se vedhæftede video.

<https://vimeo.com/402911809>

Yderligere uddybning

Dette cykliske design fortjener yderligere uddybning. bl.a. på en nøjagtig kurveberegning og valg af overflade. I lyset af byggeriets status vil dette skulle ske i den nærmeste fremtid.

Dette synes muligt og gennemførligt, men falder uden for cykelparkeringsholdets rammer.

Bilag 4 Pjece om Silodam (8. juni 2022)

THE SILODAM

Peter Elenbaas, July 2006, photography

THE **SILODAM** BLOCK OF APARTMENTS IS SITUATED AT THE END OF A DAM IN THE IJ RIVER BETWEEN **AMSTERDAM**'S CITY CENTRE AND THE WESTERN HARBOUR AREA. IT STANDS NEXT TO TWO FORMER GRAIN SILOS, NOW REMODELED FOR RESIDENTIAL AND OFFICE USE.

Jan te Kieffe, photography

The designers of the Silodam block of apartments also saw the building as a silo; not so much for storing grain but rather for living. The building holds 142 privately owned apartments and 15 social rented apartments, including a commune for the elderly. A 600 m² office space extends out into the IJ river.

A high-tech, fully automated and computer-controlled parking facility is hidden below street level at the Silodam. It consists of four modules with tightly packed parking places.

HISTORY

The oldest building on the Silodam is the brick grain silo in the middle, designed by Klinkhamer and Van Gendt. It dates from the late 19th century and was part of the Amsterdam fortifications. It never served that purpose and instead was used by the grain trade. Now, it has been converted into apartments, office spaces and artists' studios. In spite of this new use, the building is listed as an industrial monument.

The first building that meets the eye entering the Silodam is the concrete grain silo built in the middle of the twentieth century, designed by Postma. This building now also holds offices and apartments. Though many windows were put in, the building retains its industrial appearance. The remodeling of both buildings was done by father and son Van Stigt.

The Silodam block of apartments was built at the beginning of this century. With its contemporary architecture, it is different from the other two buildings in form and original function, but not in volume.

The architect of the building was Nathalie de Vries of the architects collective MVRDV. De Principaal BV and RABO

Vastgoed were the development corporations for the Silodam block of apartments. De Nijs BV from Warmenhuizen was the contractor.

The sale of the properties took place by a lottery. Only one out of ten of the applicants was given the opportunity to purchase an apartment. Such great interest was not surprising, considering the location and the price which was two-thirds of the market price for similar apartments in Amsterdam.

DESIGN AND FORM

When MVRDV was selected to build mixed housing in Amsterdam's docklands area, it started assembling information on all the factors that could play a role in the site's design and construction. From zoning laws, building regulations and technical requirements to client wishes, climatic conditions and the political and legal history of the site. The architects loaded a software program with these parameters. The program shows optimal building shapes for any given set of priorities (maximizing sunlight, views or privacy) and pushes limits to the extreme, where they can be seen, debated and, often, undone. This data scape was the basis of the design and of the negotiations with the parties involved, such as local politicians, the planning authority and possible future residents, all of whom advocated for a different distribution of the housing. With the help of the computer the Silodam took shape: 157 apartments of various sizes and forms that sit together in one 10-storey block that rises on stilts from the harbour like a docked container ship.

From the outside, the Silodam looks simple enough, like a child's giant Lego construction. The rectangular block (130 by 20 metres) consists of parts with different colours and materials; the geometry reminding of 'The Stijl'. The block is filled with a variety of dwellings arranged into 'mini-neighbourhoods', while corridors allow residents to walk from one end of the 'ship' to the other. To visitors it sometimes appears as a dazzling labyrinth.

The apartments vary as much in size (from 60 to 220 m²) as in design. In addition, owners are free to make changes to their apartments, resulting in even greater diversity. Among the types one finds maisonettes, terrace apartments and studios. Fancy names used by the architects characterize the style of the apartments, for instance, Water, Panorama, X-house and Venetian Window.

CHARACTERISTICS

The building stands on stilts above the water. A concrete dam just below the water level prevents ships from crashing into the building.

The various apartment styles are grouped into small neighbourhoods. A neighbourhood shares façades, colour of corridors and window design. The X-houses on the 7th and 8th floors for example, have a grey façade with four windows each and an aluminum siding. The corridors of the X-apartments have walls and ceilings painted yellow while the floors are covered with a bright yellow carpet. The architects chose wood, brick, metal or composite material of different colours to identify other neighbourhoods combined with blue, green or red corridors.

- Most apartments share a middle corridor while some have an entry from an outer gallery or a private bridge leading to the street.
- The single floor business space is an extension of the main building into the IJ river, one storey above the water. A wide staircase leads to the roof of the business space, a large public terrace. It is known as 'The Tray' and the Silodam residents have decided to keep it nearly empty. At the northern end of the building, on the 7th floor, one finds a second open terrace. It is called 'The Crow's Nest' and is accessible to residents only.
- Underneath the building is a marina where visitors and residents may moor their boats. One of the residents of the Silodam is the harbourmaster.

SURROUNDINGS

The Silodam building is a remarkable element in an environment with a mixture of historic and new buildings. Westerdoks Island, a former train-switching area between the Silodam and the city centre, is transformed into condos, restaurants, shops and offices. Various architects, including MVRDV, cooperated to realise this complex.

A new plan changes the old harbour on the north-west side into an area with 950 residential and business spaces, built on artificial islands, next to a huge tower. On the northern bank of the IJ river Shell established a new R & D laboratory. Facing the central train station on the northern bank new housing blocks and a very popular film museum were situated. The former Shell Tower and NDSM dockyard are transformed in spaces

for culture, tourism, fun and offices.

Just south of the Silodam, three islands can be found, dating back to the 17th century. The Prinsen Island and the Realen Island maintain their historic character. One finds old houses and splendid examples of warehouse-to-apartment conversions. A new building on Bickers' Island consists of a rare combination of a school, designed by Herzberger Architects, and apartments designed by HM Architects.

Further west of the Silodam is the Spaarndammer neighbourhood, with well-preserved examples of the Amsterdam School, like Michel de Klerk's 'palaces for workers'. The former post office in one of these buildings, 'Het Schip' (The Ship), now presents a permanent Amsterdam School exhibition.

LIKE A VILLAGE

For 157 condos in a box, there is more of a sense of community than one would expect after thirteen years in a small metropolis. It helps that we are situated at the end of a dam: there is no through traffic. People meet and greet each other in the elevators, waiting for their cars at the underground garage or fetching or chaining their bicycles. Some simple benches at the end of the dam are used by families with young children and function as a place to sit, eat, drink and socialize with neighbours when the weather is good. The big windows add to social control, some observers note that it is one of the safer spots of Amsterdam.

Many inhabitants came to stay because of the quality of living. There is a very active organization of home-owners with a huge attendance at annual meetings and volunteers in committees. For example, a dozen volunteers give guided tours for many architectural tourists from all over the world. Communal events, partly financed by the guided tours, are Sinterklaas, Christmas, New Year at The Crow's Nest and the annual barbecue. Some empty spaces inside the building are being used now for free book and toy libraries. 'Village politics' can be fierce around issues like the heat in the building, the carpet in the corridors and the presence of personal things in public spaces.

Geleiding regenwater over de weg

Bij herstructurering en bij nieuwbouwwijken kan de weg zo aangelegd worden dat het regenwater naar gebieden loopt waar het minder schade veroorzaakt.

Het geleiden van water via de weg kan op twee manieren of door de weg op een oortje eggen of door verspreiden van de weg aan te brengen. Wegen kunnen ook zo ingericht worden dat ze water bufferen en zager geslagen-uwetsbare gebieden ontzien. Het is hierbij belangrijk om rekening te houden met de locatie van verkeersbussen en opritten, zodat deze de geleiding of tijdelijke berging niet tegengaan.

Let wel op dat de dubbele functie van deze verkeersbussen behoudt. Bij de publieke organisatie, zodat bij een heropbouw van de straat de verkeersbussen blijven bestaan.

Holle weg

Een holle weg vergroot de bergings- en afvoercapaciteit van de straat. Gecombineerd met een trottoir en een lats verhoogt vloerpeil en/of drempel in huizen, kan dit wateroverstoot voorkomen.

Holle wegen kunnen veel meer water bijgen en afvoeren dan open groen of normale bol gegolde wegen. Afhankelijk van vervul zijn vaak minder een belemmering voor het overbruggen van afvalstoffen die groter zijn dan de bij open groen, gemiddeld 50 meter, doordat de afstand tot de bebouwing vaak groter is en er dus nog meer met de weggevoerde afvalstoffen geïntegreerd kan worden.

Overzicht het verkeer ook tijdens regen gebruik maakt van deze wegen. Kan dit leiden tot opvallende vooruit. Communicatie over aangelegd. Gedrag is nodig om het gemeentelijke voor komen die de huizen kunnen benutten.

Figure 4.2 The principles underpinning the flood probability standards for primary flood defences.

- Local Individual Risk

$$\text{LIR} = P \text{ flood} * \text{mortality} * (1 - \text{evacuation fraction})$$

Parallels... CHP - NL

Figure 4.8 The basic principle of economic optimisation. The total costs (K) are equal to the investment costs (I) associated with improving reliability (here: heightening levees) plus the present value of the risk (R). The optimum lies at the point where the total costs (I+R) are lowest.

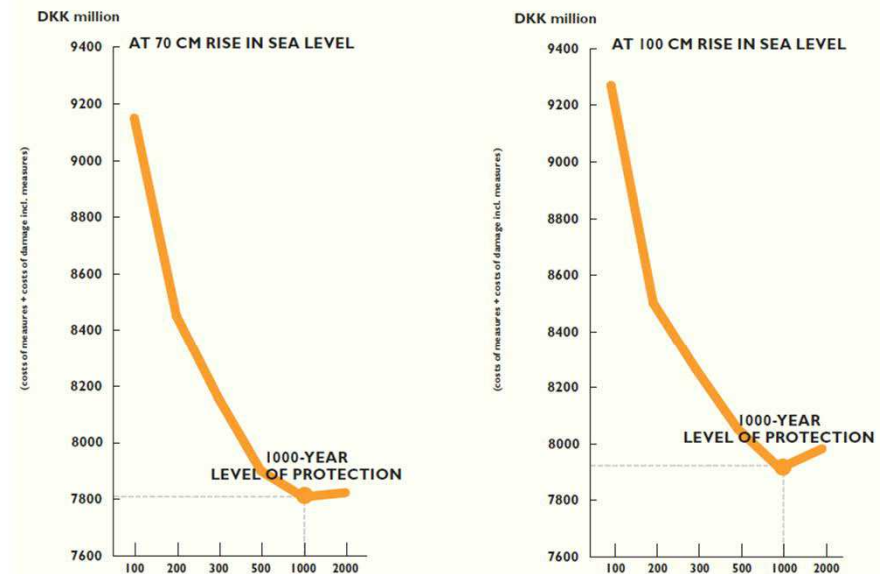

FIGURE 8: CALCULATED ECONOMICALLY OPTIMUM LEVEL OF PROTECTION

— Total costs (costs of measures + costs of damage incl. measures)

The reason why 'costs of damage incl. measures' is included is that even when protection measures are taken, damage could arise from a statistical point of view. The background to the economic results can be found, for instance on page 10 of the COWI report 'Opdateret overslag for sikring af København mod stormflod' ('Updated estimate for protection of Copenhagen against storm surges') (April 2017). Regarding uncertainties in economics, see page 20 of the present plan.

Beaches and dunes are inherently dynamic systems that reduce land loss and inundation risk of the hinterland while providing high amenity and environmental benefits.

The Hague, The Netherlands. <https://beeldbank.rws.nl>, Rijkswaterstaat / Joop van Houdt

From CPH Storm Surge Plan 2017

If the storm surge plan is adopted, work should take place in a further initiative on a funding model that views the city as a whole. It may, for example, mean involving consideration of the protection of Copenhagen's public functions, so that these have a prominent input to a model for funding solutions.

A model is to be created in discussion with a number of the city's actors, neighbouring municipalities and the Danish Coastal Authority that is regarded as fair, transparent and easy to use in calculating contributions.

Funding Dike updrages (reinforcement) Regional Water Authorities

Annually

- 380 mln € National Government and Regional Water authorities.
- 50% Rijkswaterstaat
- 40% All Water authorities together
- 10% receiving Water authority

Own taxes for daily maintenance of flood defence and other watermanagement

Taxes:
- 20-60% inhabitants, depending on population density. CPH would be 50-60%
- rest based on economic value property

Summary

- Daily maintenance = Regional government
- Large scale upgrade = 50% national 50% regional
- Large infrastructure of national importance = 100% national

All based on taxes, no direct private investment (there is for extra's, like additional amenities)

Bottom line: Everyone pays of flood risk reduction. Roughly 0.2 percent of GDP. That is al lot of money but is not expensive.

Green Deal Timber construction MRA 2021 - 2025

From covenant to action plan
Timber construction MRA 2021-2025

9 June 2022
Imme Groet

Metropolitan Region of Amsterdam

Agenda

This presentation...

- Why this project
- The ambition
- Central themes of the covenant
- Examples
- Collaboration
- Process to come to a covenant
- Action plan
- Questions?

The ambition

State of the region – ‘Sustainable out of the crisis’

- Minimum 20% of the residential construction will be produced in timber from 2025 in the MRA
- 20% = current residential production, approximately 3.000 houses per year
- Residential production = new construction
- Timber = biobased construction as an overarching understanding
- From 2025 = increase the production in the coming years to the 20% in 2025
- MRA = not every municipality has to work to a 20% share timber in all the new construction of houses. Percentages can differ between municipalities.

The ambition

Why timber

- Reduction of emissions (CO2, nitrogen, particulate matter), Paris Agreement
- Renewable resources
- Innovation in the value chain of construction
- Accelerate housing production
- Modernize of employment (sustainable economy)
- Public-private collaboration – renewe knowledge and methods

Central themes

Timber construction

- Definition
- Locations
- Knowledge development and sharing
- Legislation
- Costs and businesscase

Central themes

Definition

Each individual residential building fulfills the desirable criteria and accounts for the cumulative percentage of 20% timber construction in the MRA, if the volume of the supporting construction (ex. foundation):

- For ground-level buildings a minimum of 80% of the volume is biobased,
- For stacked buildings under 10 floors a minimum of 65% of the volume is biobased,
- For stacked buildings 10 floors and above a minimum of 50% of the volume is biobased,

The timber for the supporting construction comes by preference from Europe, the building is assembled in Europe (by preference in The Netherlands) and the timber is certified for a minimum of “70% FSC mix” and/or “70% PEFC”.

Central themes

Locations

Pointing out locations for realizing timber buildings is one of the main topics of the Covenant Timber Construction 2021-2025.

- On one hand to assure locations for timber buildings in the MRA.
- On the other hand to control whether the ambition of 20% from 2025 onwards will be achieved.

The private real estate parties for pointing out locations are: AM, BPD, Bouwinvest, De Nijs, De Alliantie, Dura Vermeer, Parteon and Synchronon.

The public parties are: Almere, Lelystad, Amsterdam, Zaanstad, Haarlemmermeer, Haarlem, Purmerend en Beverwijk

Central themes

Knowledge development and knowledge sharing

- Knowledge development: which knowledge is not present yet and requires further research:
 - Know (basic knowledge)
 - Capable (skills)
 - Will (ambitions)
 - Do (actions).
- Education: which trainings have to be developed and given;
- Knowledge sharing: which communication do we use:
 - Tekstual: such as a website, FAQ, report, guideline, research articles
 - Meetings: such as knowledge sessions, market consultations or knowledge meetings
 - Demo: such as excursion, exposition, demo building or experiments

Central themes

Legislation

- National legislation with impact measurement of a building.
- Local legislation when it comes to look and feel of a neighborhood, fire department safety and acoustics.
- Usage of financial or stimulation policy instruments to help a smooth implementation of timber construction
- Subsidies for experimental usage of biobased materials

Central themes

Costs and businesscase

The main perspective on timber construction is that this is more expensive, compared to conventional construction. However, this imagine is nuanced.

- Land costs
- Direct construction costs
- Development costs
- Sales costs
- Exploitation costs
- Exit-value

Societal value of timber construction. The physical properties of timber increase the general wellbeing of humans, help concentrate, work productivity, healthy environment, etc.

Collaboration

Main team

Bob van der Zande

Imme Groet

Broader team

Lex Brans

Wouter van Twillert

Ivo Hamelynck

In collaboration with the tripple helix: knowledge institutes, public parties and private parties

Collaboration

Steering committee

5 aldermans (public)

5 directors (developers, housing corporations)

1 professor

Core team

Civil servants, a variety of market parties and knowledge institutions – 20 participants

Broader projectteam

Civil servants, a variety of market parties and knowledge institutions – 70 participants

Process

Meetings

Regular meetings and review of results with the different groups

Party-specific meetings

Based on knowledge need and questions, specific meetings per group stakeholders (municipalities, investors, contractors, etc.)

Agreements

3 types of agreements:

- On main themes
- Agreements for the future
- Agreements per type of party

Process – example

Municipalities

- They designate suitable locations for timber construction, for the short and the longer term. From 2022, municipalities will annually designate at least 1 location for timber construction and ensure that this location is put on the market
- They work on increasing internal expertise in timber construction at an early stage by attending information and expert sessions for relevant officials and sharing knowledge between the relevant internal units and experience within the MRA with other municipalities,
- They will positively appreciate project proposals from the market for timber construction and support them in the elaboration,

Green Deal Houtbouw

Actionplan MRA

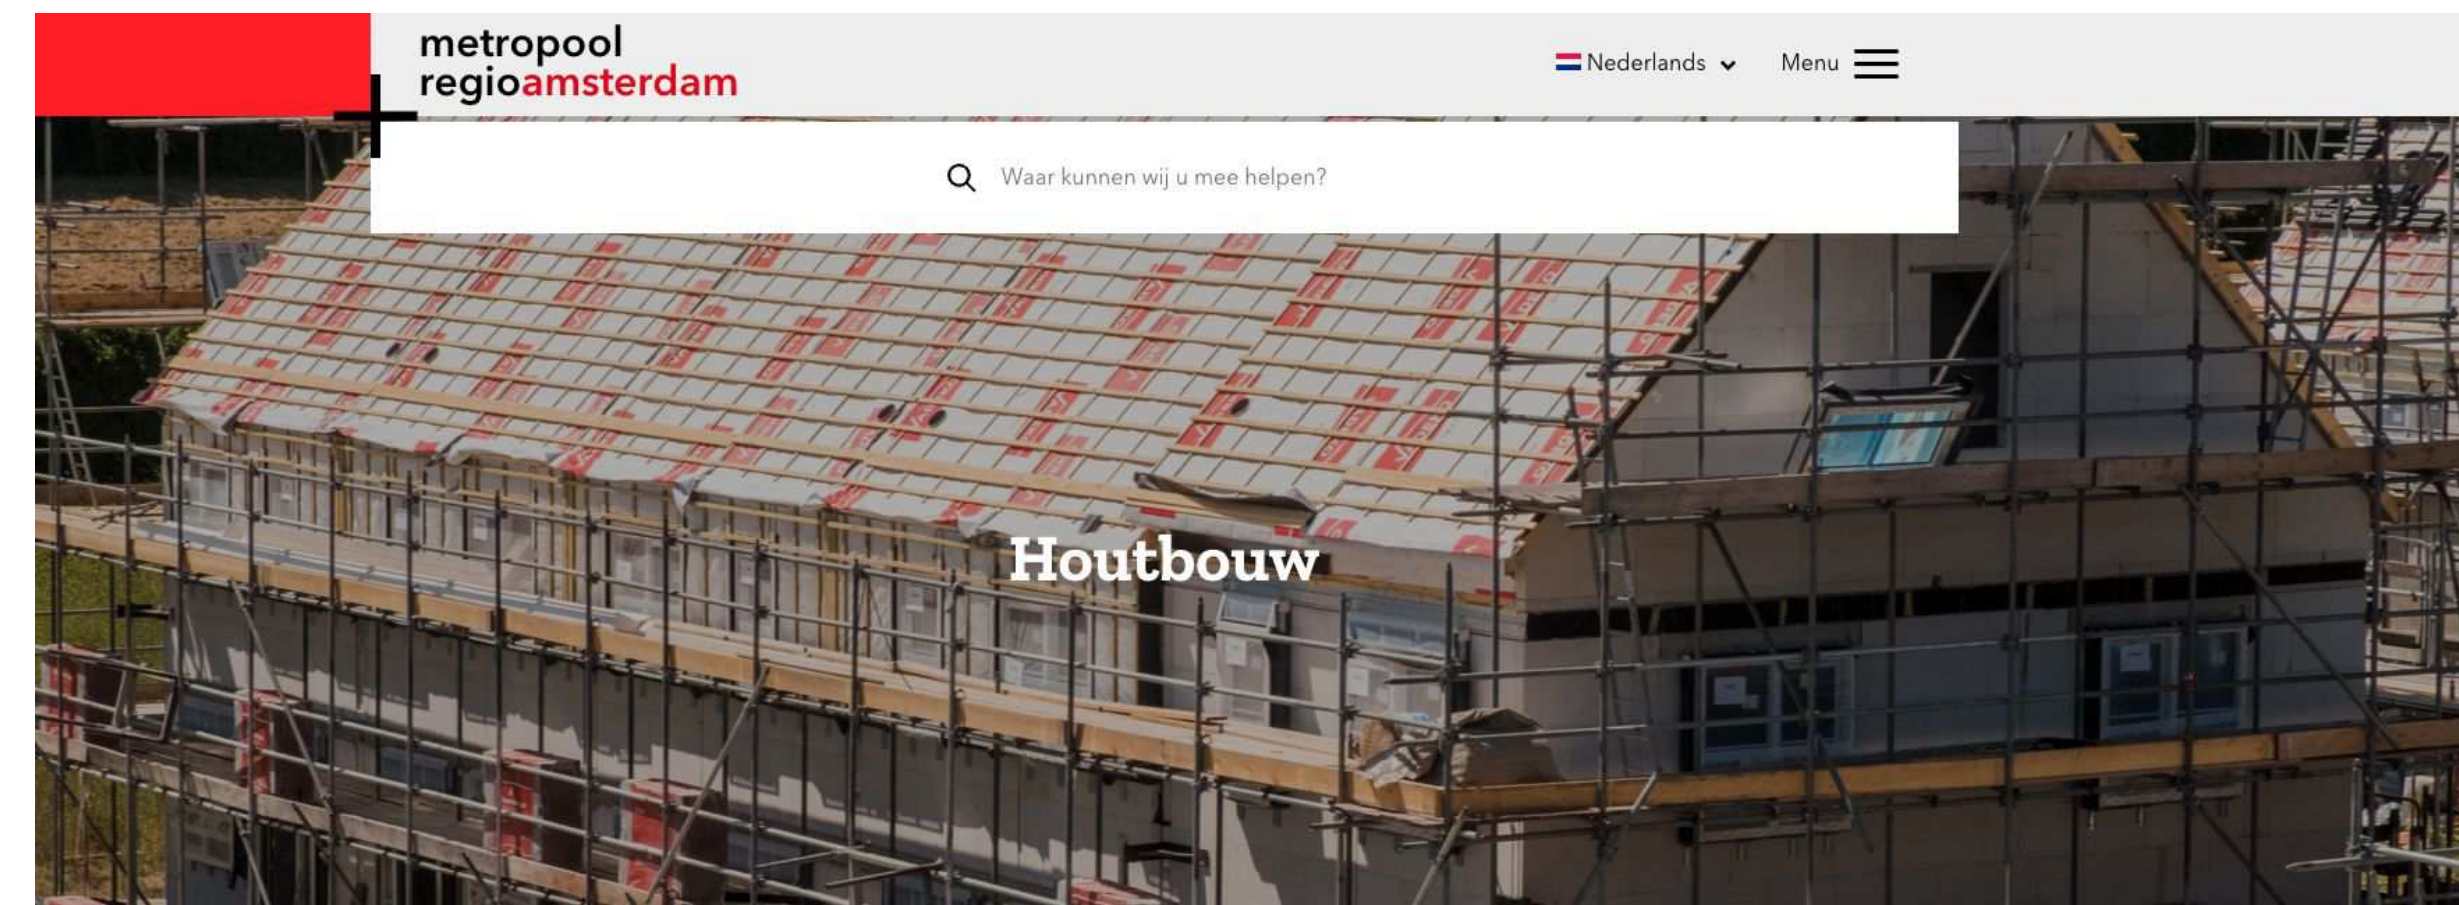

Green Deal timber construction MRA – start action plan from 2022 with five action themes:

Costs and businesscase

- Project together with Arcadis and Alba Concepts
- 13% more expensive, with peaks to 23% for foundation costs
- Integrate other costs in the perspective
- Collect burden of proof

Communication strategy

- Page
- Newsletter

Vanaf 2025 is 20% van de woningproductie in de Metropoolregio Amsterdam (MRA) van hout en andere biobased materialen, zodat woningen sneller en duurzamer worden gebouwd. Dat levert jaarlijks een reductie op van circa 220.000 ton CO₂-uitstoot en een aanzienlijke vermindering van de uitstoot van stikstof. Houtbouwoningen die op een industriële wijze worden geproduceerd en op voldoende locaties kunnen worden gebouwd, zijn betaalbaarder, gemaakt van gezonde materialen en zorgen voor minder bouwafval. Voor de ambitie in de MRA is een convenant opgesteld.

De Green Deal Convenant Houtbouw is opgesteld in een intensieve 'triple helix'-samenwerking:

Actionplan MRA

PAKHUIS DE ZWIJGER

HOME AGENDA LIVECAST MAGAZINE PODCAST PROJECTEN DOSSIERS EETCAFE VERHUUR OVER ONS NL EN

Waar niet-hernieuwbare materialen zoals beton, staal en baksteen in de laatste eeuw de meest gebruikte bouwstoffen waren om steden te bouwen, worden de negatieve effecten van deze fossiele bouwmaterialen op het klimaat steeds duidelijker. Hernieuwbare, of biobased materialen, met in het bijzonder hout, bieden een totaaloplossing voor het (her)ontwikkelen van een 'future proof' gebouwde omgeving. Op welke manier kunnen biobased materialen bijdragen aan de woningbouw en klimaatopgave van ons land? Tijdens deze avond staat het gehele pand in het teken van houtbouw.

Dit programma is enkel fysiek te bezoeken in onze zaal. Het programma is wel later online terug te kijken via dezwijger.nl/terugkijken of via ons YouTube-kanaal.

Actionplan MRA

Green Deal timber construction MRA – start action plan from 2022 with five action themes:

Legislation

- Collaboration with CircuLAW
- Legal status Covenant
- Issues with allotment of land
- TO Juli
- Issues with fire, acoustics and water damage

Wensen en eisen

1.2 Samenvatting richtlijnen

Het privaatrechtelijk en het publiekrechtelijk spoor worden in 5.3 en 5.4 beschreven. Hieruit leiden wij enkele belangrijke richtlijnen af voor het stellen van circulaire eisen in contracten en planregels die zien op circulariteit:

- Strengere eisen in contracten zijn alleen mogelijk op basis van gelijkwaardigheid;
- Convenanten en (green) deals borgen gelijkwaardigheid. Het is daarbij verstandig zoveel mogelijk concrete doelstellingen, prestaties en tijdspaden op te nemen, zodat deze afdwingbaar zijn;
- Met een aanbesteding kan ook bereikt worden dat gebouwen duurzamer worden dan het Bouwbesluit voorschrijft, mits op juiste wijze ingericht;
- De gemeente kan voor haar eigen gebouwen wel een duurzamer resultaat dan het Bouwbesluit willen;
- Regels in het bestemmingsplan moeten ruimtelijk relevant zijn en mogen niet in strijd zijn met het Bouwbesluit;
- Het Bouwbesluit bevat technische bouwvoorschriften over gebouwen. Het Bouwbesluit staat dus niet in de weg bij regels over de openbare ruimte en percelen. Ook regels die geen technisch bouwvoorschrift zijn, kunnen in het bestemmingsplan worden opgenomen;
- Met de Omgevingswet vervalt de eis van ruimtelijke relevantie. De regels in het omgevingsplan moeten toezien op de fysieke leefomgeving;

- Met het Bouwbesluit kunnen strengere regels over de energie- en milieuprestatie in het omgevingsplan worden opgenomen. Ook regels over duurzame daken voor gebouwen waar geen Beng-normering voor geldt is mogelijk.

Enkele andere mogelijkheden betreffende klimaatadaptatie, mobiliteit en andere onderdelen zijn aan het slot van dit hoofdstuk opgenomen.

1.3 Privaatrechtelijk spoor

Gronduitgifte

Als de gemeente grondposities heeft, dan kan zij een partij selecteren die de grond gaat ontwikkelen (aanbesteding). Ook kan zij die partij eisen meegeven en deze vastleggen in een overeenkomst. Denk bijvoorbeeld aan eisen over de ontwikkeling van de openbare ruimte, zoals de beschikbaarheid van loadpalen, percentages verhard/onverhard en materiaalkeuze van straatmeubilair.

Eisen gebouwen boven Bouwbesluit

De mogelijkheid om nadere eisen mee te geven voor het bouwen van gebouwen wordt beperkt door artikel 122 Woningwet. Hierin staat dat een gemeente geen privaatrechtelijke rechtshandelingen mag verrichten - met andere woorden: geen contracten mag sluiten - over onderwerpen die in het Bouwbesluit geregeld zijn. Het Bouwbesluit bevat technische bouwvoorschriften voor gebouwen zoals veiligheids-

Wensen en eisen

en toegankelijkheidseisen, maar ook eisen over duurzaam bouwen. Daarbij geldt dat het Bouwbesluit die onderwerpen uitputtend regelt. Ook als het Bouwbesluit zelf geen bepalingen bevat over bijvoorbeeld circulair materiaalgebruik, dan nog mag de gemeente geen strengere eisen opnemen in contracten. Strengere eisen dan het Bouwbesluit zijn alleen mogelijk op basis van gelijkwaardigheid tussen partijen. De gemeente mag dus geen machtspositie hebben. Gelijkwaardigheid kan gecreëerd worden met een onderliggend convenant of green deal. In het geval van de gemeente geldt dit voor het tekenen van Convenant Houtbouw en City Deal Circulair en Conceptueel Bouwen.

Dergelijke convenanten of deals zijn vaak gestoeld op inspanningsverplichtingen of algemene ambities. Wij adviseren zoveel mogelijk te streven naar concrete doelstellingen en goed omschreven prestaties, eventueel oplopend in de tijd.

Op deze wijze is geborgd dat deze ook in concrete opgaven en ontwikkelingen kunnen worden geëist.

omdat de gelijkwaardigheid tussen partijen geborgd moet blijven. Dat zou kunnen doordat een partij de aanbesteding ook kan winnen door binnen de eisen van Bouwbesluit te blijven. Immers, dan is het de vrije keuze van de partij om strengere eisen toe te passen. Dat betekent dat selectie-eisen, gunningscriteria en contractuele voorwaarden die ruimte wel moeten bieden. Anderzijds kan een goede inrichting van deze documenten de kans aanzienlijk maken dat alleen partijen die zo duurzaam mogelijk willen bouwen, een inschrijving indienen.

Met de komst van de Omgevingswet wordt artikel 122 Woningwet vervangen door artikel 23.7 Omgevingswet. De strekking blijft gelijk en daarmee ook de analyse op dit punt.

Grondexploitatie

In de overeenkomst waarin de gemeente de gronduitgifte heeft opgenomen, regelt de gemeente vaak de afspraken over kosten van de grondexploitatie over de gronden in het te ontwikkelen gebied. Vooral de kosten voor het bouw- en woonrijp maken van het te
